

ABSTRACT OF THE DISCLOSURE

[041] The present invention is herein described as a computerized method for checking and clearing relationship problems in an organization including a plurality of members and a conflicts administrator. The present invention receives and stores data denoting existing client information within a central database. Upon potential client information being inputted, the information is processed and forwarded to be electronically compared with stored existing client information to determine if any matches are present. Additionally, the present invention receives and transmits potential client information for display upon each of a plurality of terminals such that each member of the organization may review potential client information and communicate any potential conflicts of interest. The individual requesting a conflict check or new client file is provided with an electronic record illustrating the results of the comparison performed by the system as well as feedback from each member of the organization.
